

ABSTRACT OF THE DISCLOSURE

A soap scum scraper for removing soap scum from the surfaces of showers, sinks, and around faucets. The soap scum scraper includes an elongated handle suitable for being gripped by a user and a blade having a section of an edge
5 connected to the handle to enable a user to manipulate the blade, the blade also having at least one edge contoured for scraping scum from a selected surface. The blade in the preferred embodiment includes a perimeter having one substantially linear edge section, one convex edge section, and a concave edge section terminating in a point with each of said edges being interconnecting to adjacent
10 edges. The multiple geometries of the blade edges allow the user to scrape scum from flat surfaces and tight spots from around the control knobs of a water faucet, cracks and corners.
